(REV 5-93) TRANSMITTAL LETTER TO THE UNIT	TED STATES	225/50412			
DESIGNATED/ELECTED OFFICE (DO/I		U.S. APPLICATION NO. (if known, see 37 CFR 1.5)			
A FILING UNDER 35 U.S.C. 371		09/937377			
INTERNATIONAL APPLICATION NO. PCT/EP00/01914	INTERNATIONAL FILING DATE 04 March 2000	PRIORITY DATE CLAIMED 23 March 1999			
TITLE OF INVENTION PROCESS FOR PRODUCING A CATALYTIC CO	ONERTER				
APPLICANT(S) FOR DO/EO/US					
BERGINGER, Andreas; BRITZ, Peter, DAHLHOF STÄB, Gabriele; and URBAN, Peter	FF, Ellen; HÖLDERLICH, Wolf	fgang; SCHNEIDER, Martin;			
Applicant herewith submits to the United States Designated/Elect	ted Office (DO/EO/US) the following ite	ms and other information:			
1. X This is a FIRST submission of items concerning a filing	g under 35 U.S.C. 371.				
2. This is a SECOND or SUBSEQUENT submission of ite	ems concerning a filing under 35 U.S.C.	371			
3. X This express request to begin national examination pro examination until the expiration of the applicable time	ocedures (35 U.S.C. 371(f) at any time ra limit set in 35 U.S.C. 371(b) and PCT A	ther than delay rticles 22 and 39(1).			
4. X A proper Demand for International Preliminary Exam	ination was made by the 19th month fro	om the earliest claimed priority date.			
5. X A copy of the International Application as filed (35 U.S	S.C. 371(c)(2)).				
a. is transmitted herewith (required only if no	ot transmitted by the International Bure	au).			
b. X has been transmitted by the International I	Bureau				
c. is not required, as the application was filed	in the United States Receiving Office (R	(O/US)			
6. X A translation of the International Application into Eng	glish (35 U.S.C. 371(c)(2)).				
7. Amendments to the claims of the International Applica	ation under PCT Article 19 (35 U.S.C. 3	71(c)(3))			
a. are transmitted herewith (required only if	not transmitted by the International Bu	reau).			
b. have been transmitted by the International	Bureau.				
c. have not been made; however, the time lim	it for making such amendments has NO	T expired.			
d. have not been made and will not be made.					
8. A translation of the amendments to the claims under H	PCT Article 19 (35 U.S.C. 371(c)(3)).				
9. X An oath or declaration of the inventor(s) (35 U.S.C. 37	71(c)(4)) (unexecuted).				
10. X A translation of the annexes to the International Prelin (35 U.S.C. 371(c)(5)).	minary Examination Report under PCT	Article 36			
Item 11. to 16. below concern other document(s) or information	included:				
11. X An Information Disclosure Statement under 37 CFR 1	1.97 and 1.98.				
12. An assignment document for recording. A separate co	over sheet in compliance with 37 CFR 3.2	28 and 3.31 is included.			
13. X A FIRST preliminary amendment.					
A SECOND or SUBSEQUENT preliminary amendme	ent.				
14. X A substitute specification.					
15. A change of power of attorney and/or address letter.					
16. X Other items or information:

Title: PROCESS FOR PRODUCING A CATALYTIC CONVERTER

PRELIMINARY AMENDMENT

Assistant Commissioner for Patents Washington, D.C. 20231

Sir:

Kindly enter the following amendments to the English language translation of the international PCT application identified above prior to examination.

Please substitute the new Abstract of the Disclosure attached as Appendix I for the Abstract appearing on the last page of the translation.

Please replace pages 1-11 of the translation with the substitute specification attached as Appendix II.

Please cancel claims 1-16 of the translation and add the following new claims:

--17. A process for producing a catalytic converter, in which catalytically active material is deposited on a substrate as a porous or non-cohesive layer, as a result of the substrate being immersed in an electrolyte which contains the catalytically active material and voltage being applied between

the substrate and a counterelectrode, comprising:

depositing the catalytically active material on a metallic substrate, and

applying an electric direct voltage, on which an alternating voltage is superimposed in such a way that the sign of the sum voltage of direct and alternating voltage does not change, between the substrate and the counterelectrode.

- 18. The process according to Claim 17, wherein the direct voltage at least corresponds to the deposition potential of the catalytically active material.
- 19. The process according to Claim 17, and further comprising providing the substrate, on its surface which is to be coated, with a predetermined surface roughness prior to the deposition.
- 20. The process according to Claim 19, wherein the surface roughness is in the range from 0.3 μm to 10 $\mu m.$
- 21. The process according to Claim 17, wherein the catalytically active material is deposited as substantially spherical metal clusters as a result of the alternating voltage component being applied with a frequency of over 50 Hz.
- 22. The process according to Claim 17, wherein the catalytically active material is deposited as substantially

dendritic metal clusters as a result of the alternating voltage component being applied with a frequency of between 5 and 50 Hz.

- 23. The process according to Claim 17, wherein the catalytically active material is a precious metal, a mixture of precious metals or catalytically active materials, or a mixture of precious metals and catalytically active materials.
- 24. The process according to Claim 17, wherein said metallic substrate is a stainless steel substrate, and wherein substantially spherical platinum clusters are deposited on said stainless steel substrate from a solution of a platinum compound in $0.1~M~H_2SO_4$ with a platinum content of approximately 0.1~g/l as a result of a modulated voltage, comprising said direct voltage of approximately 1.3~ volts superimposed with said alternating voltage with a voltage swing of 0.3-1~ volt and a frequency of 50-100~ Hz, being applied between said stainless steel substrate and said counterelectrode.
- 25. The process according to Claim 17, wherein said metallic substrate is a stainless steel substrate, and wherein substantially dendritic platinum clusters are deposited on said stainless steel substrate from a solution of a platinum compound in 0.1 M $\rm H_2SO_4$ with a platinum content of approximately 0.1 g/l as a result of a modulated voltage, comprising said direct voltage of approximately 1.3 volts superimposed with said alternating voltage with a voltage swing of 0.3-1 volt and a

frequency of 5-15 Hz, being applied between said stainless steel substrate and said counterelectrode.

- 26. The process according to Claim 17, wherein said metallic substrate is a stainless steel substrate, and wherein substantially dendritic rhodium clusters are deposited on said stainless steel substrate from a solution of a rhodium compound in 0.1 M $\rm H_2SO_4$ with a rhodium content of approximately 0.2 g/l as a result of a said direct voltage of 1.4-1.6 volt applied between said stainless steel substrate and said counterelectrode and said alternating voltage ($\rm V_{ac}$) with a voltage swing ($\rm V_{PP}$) of 0.3-1.5 volts and a frequency of 5-15 Hz being superimposed.
- 27. The process according to Claim 24, wherein the platinum clusters have sizes between 2 nm and 1 μm .
- 28. The process according to Claim 17, wherein the counterelectrode is formed by platinum-coated titanium.
- 29. The process according to Claim 25, wherein the platinum clusters have sizes between 2 nm and 1 $\mu\text{m.--}$

REMARKS

This Preliminary Amendment is being filed in order to incorporate specification and claim amendments reflected in the annexes to the International Preliminary Examination Report into the present U.S. national stage application, to improve the form of the specification and abstract, and to place the claims of this U.S. national stage application into a form which is more appropriate for examination in the United States.

A marked-up version of the substitute specification, showing matter added to the translation by underlining and matter deleted from the translation between brackets, is attached to the Preliminary Amendment as Appendix III. The substitute specification is believed to contain no new matter.

Process for producing a catalytic converter

5 The invention relates to a process for producing a catalytic converter.

disclosure JP-A-08 134 682 has described electroplating process for coating a metallic substrate with a smooth precious metal layer, in which an ironcontaining substrate is provided with covering. The patent DE 197 32 170 C2 has disclosed a process for covering a ceramic SiC substrate in a locally selective manner with a platinum covering, the surface of which matches the rough ceramic surface, as a result of a direct voltage being applied between the substrate and a counterelectrode. The coated substrate is then treated at elevated temperature of over 400°C.

EP-A-106 197, which forms the starting point for the 20 invention, has disclosed a process for the electrochemical deposition of a porous platinum layer. The layer deposited on a carbon or semiconductor substrate. In this process, a one-off high voltage pulse is applied between 25 substrate and counterelectrode, so that nuclei deposited on the substrate. There then follows a prolonged pulse at a lower voltage, during which growth of the nuclei takes place. US-A-4,273,624 has disclosed electroplating process in which a thin, continuous layer 30 of platinum is deposited on an SnO2 substrate. JP-A-7 80 327 has disclosed a catalytic converter in which a metallic substrate is coated with a thin, non-porous layer of precious metal. The lack of pores means that the catalytic converter is distinguished by a high resistance 35 to oxygen.

AMENDED SHEET

15

Internal file ref.: P033547/W0/1

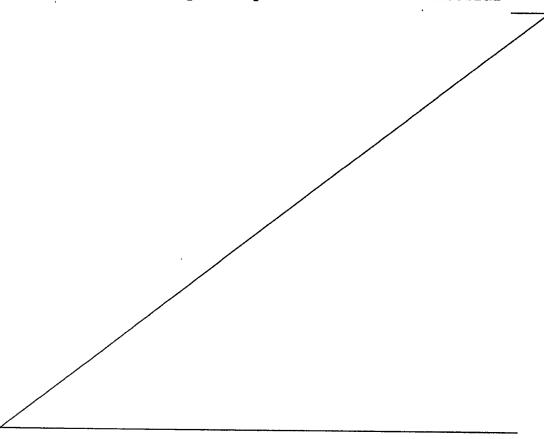

Page 8 15.02.2001

Additional page 1a

The object of the invention is to provide a process for coating a metallic substrate which allows the deposition of a precious metal with a large surface area and good adhesion to a substrate.

This object is achieved by the features of the independent claim.

According to the invention, a layer of catalytically active metallic material is deposited on a metal substrate by means of electrochemical deposition, the substrate being immersed in an electrolyte which contains the catalytically active metallic material

AMENDED SHEET

many group, grows super seasy group, 101. In the species of grows and super species group.

10

15

catalytically active material being deposited on the substrate as a porous or non-cohesive layer.

It is particularly advantageous for the substrate to be provided, on its surface which is to be coated, with a predetermined surface roughness prior to the deposition, the surface roughness preferably lying in the range from 0.3 μ m to 10 μ m. A further preferred range for the surface roughness is between 0.3 μ m and 3 μ m. The surface roughness is expediently generated by thermal and/or mechanical and/or chemical treatment.

The catalytically active material is preferably formed from metal clusters with a diameter of between 2 nm and 1 μ m, preferably between 2 nm and 300 nm.

The particular advantage of the process is that it is possible to deposit catalytically active layers with a very large surface area and a relatively low level of catalytically active material. The layers exhibit good adhesion and are stable at high temperatures even after prolonged use.

- Preferred catalytically active materials are precious 25 metals. One suitable catalytically active material is platinum. A preferred counterelectrode is formed by platinum-coated titanium sheet. A further preferred counterelectrode consists of platinum-coated nickel.
- 30 particularly preferred refinement of the invention, platinum is deposited with different morphologies. This provides catalytic converters which have different selectivities for conversion of matter. For example, it is possible to produce a preferred 35 platinum catalytic converter for a reforming reactor which, despite a high carbon monoxide concentration in an H₂/CO mixture, has a continuously high activity for hydrogen conversion in operation.

20

25

Further advantages and configurations of the invention will emerge from the further claims and the description. The invention is described in more detail below with reference to a drawing, in which:

Figure 1 shows an outline view of a structure for carrying out the process according to the invention,

10 Figure 2 diagrammatically depicts a section through a coated surface,

Figures 3a, b show two scanning-electron microscope images of the surface of a catalytic converter with dendritic platinum clusters,

Figure 4 shows a scanning-electron microscope image of the surface of a catalytic converter with spherical platinum clusters,

Figures 5a, b show two scanning-electron microscope images of the surface of a catalytic converter with dendritic platinum clusters before (Figure 5a) and after (Figure 5b) a long-term test,

Figures 6a, b show a comparison of rough (Figure 6a) and smooth (Figure 6b) surface profiles of steel substrates prior to the coating with catalyst material,

- 30 Figure 7 shows a measurement curve indicating the hydrogen conversion achieved by a catalytic converter with spherical platinum clusters in a CO-containing atmosphere, and
- 35 Figure 8 shows a measurement curve illustrating the conversion of hydrogen achieved by a catalytic converter with dendritic platinum clusters in a CO-containing atmosphere.

Figure 1 shows an arrangement for carrying out the process according to the invention. A function generator 1 generates a modulated voltage which is amplified in an amplifier 2 and is applied between an anode 3 and a substrate 4 which is to be coated in a deposition bath 5. A direct voltage $V_{\rm dc}$ is preferably superimposed with an alternating voltage $V_{\rm ac}$. The sum voltage of direct voltage $V_{\rm dc}$ and alternating voltage $V_{\rm ac}$ is also referred to below as the modulated voltage $V_{\rm m}$. The alternating voltage is expediently sinusoidal, but may also adopt other forms, for example sawtooth or square-wave form.

The catalytically active material 6 is deposited on the substrate 4 in the form of clusters. According to the invention, the clusters may have different forms which can be predetermined by the deposition parameters. The substrate 4 which is coated with catalytically active material 6 then forms the catalytic converter.

The direct voltage $V_{\mbox{\scriptsize dc}}$ is preferably at least as great as the deposition potential of the catalytically active material 6 on the substrate 4, particularly preferably at most 50% higher. The precise level of the direct 25 voltage V_{dc} is dependent on the constituents and process employed may, for example, and conditions different values for differently pretreated substrates, although these values do not usually differ greatly from one another. When depositing mixed systems as 30 catalytically active material, it is also possible for the preferred direct voltage V_{dc} to lie below this deposition potential.

35 Stainless steel, particularly Cr-Ni steel 1.4541 or CR-Ni steel 1.4571 or Cr-Al steel 1.4767 is used as a particularly suitable substrate. It is expedient for the substrate to be sand-blasted or roughened in some

other way, for example chemically, and to undergo alkaline degreasing prior to the coating. This improves the adhesion of the catalytically active material 6 to the substrate 4.

5

10

15

20

In a preferred embodiment, the alternating voltage V_{ac} has a maximum voltage swing V_{PP} between minimum and maximum which is lower than the direct voltage V_{dc} , so that overall the sign of the sum voltage between substrate 4 and counterelectrode 3 does not change.

The current between substrate 4, which serves as the cathode during the deposition, and anode 3 is recorded and, in accordance with Faraday's law, is used as a measure for determining the quantity of catalytically active material 6 deposited, this material being contained in the deposition bath; current contributions which flow for the purpose of building up and breaking down the electrolytic double layer on account of the modulation are expediently eliminated, since they do not originate from the reduction or oxidation of cations or anions.

It is preferable to deposit precious metals in order to produce the catalytic converter. However, it is also 25 possible to deposit mixtures of precious metals. An expedient, inexpensive anode platinum-coated is titanium instead of a standard sacrificial anode made from solid platinum, which can be used to particularly 30 good effect if platinum is to be deposited catalytically active material. However, other precious metals and also other metals can be deposited in this inventive way.

35 The frequency and/or the amplitude V_{PP} and/or the voltage offset V_{dc} of the modulated voltage can be adjusted in order to optimize the deposition parameters for the particular system. The values affect both the

size of the clusters which are deposited on the metallic cathode and their morphology. Overall, the clusters on the substrate 4 constitute a large active surface area for catalytic reactions. The optimum cluster size can be set in each case for different applications by suitably selecting the deposition parameters and the duration of coating.

It is particularly advantageous for the surface of the substrate 4 which is to be coated to be roughened prior to the coating, for example by pickling or sandblasting. Other methods for increasing the surface roughness are also possible. This is illustrated in Figure 2 with reference to a diagrammatic side view of a coated surface. A substrate 4 has a roughened surface 4.1 on which spherical metal clusters 6.1 are arranged in recesses. The metal clusters 6.1 may also be deposited on the peaks or the flanks of the roughened areas.

20

25

10

15

The increased surface roughness has the advantage that deposited clusters 6.1 adhere more successfully to the substrate surface, and undesirable combining of the clusters 6.1 is suppressed. A catalytically active layer of individual clusters 6.1 is formed; the layer is preferably not continuous, but rather is formed from isolated clusters 6.1.

The surface roughness is preferably between 0.3 µm and 10 µm, particularly preferably between 0.3 µm and 3 µm. A large active surface area is formed from the finely distributed clusters 6.1. A further advantage is that the increased surface roughness even also contributes to increasing the surface area of the substrate 4 and therefore also the chemically active surface area. At the same time, the clusters 6.1 can be very small, so that overall only a small quantity of the expensive catalytically active material 6 has to be deposited,

20

25

30

35

yet at the same time the catalytic converter is distinguished by a high catalytic activity.

The adhesion of the metallic clusters 6.1 to the substrate surface 4.1 is very good. This makes the catalyst layer more resistant to erosion.

A particular advantage over conventional catalyst layers is that, according to the invention, good heat transfer from the catalyst layer to the substrate 4 is possible, since metallic clusters 6.1 are joined to a metallic substrate 4. By contrast, known, conventional layers are produced, for example, with catalyst supported catalyst materials, in which ceramic support particles are coated with a precious metal. In this case, the heat transfer between catalytically active precious metal and a substrate is significantly worse, since the ceramic particles arranged between them have only a low thermal conductivity. In addition, in a catalytic converter which is produced according to the also possible to invention, it is dispense with layers, which standard adhesion promoter the transfer additional adverse effect on heat properties between catalytically active material 6, 6.1 and substrate 4.

A substrate 4 which is coated according to the invention is therefore particularly suitable for use as an oxidation catalytic converter for treating exhaust gases in fuel cell systems. A further expedient application is for various heterogeneously catalysed processes. The catalytic converter according to the invention and the process according to the invention are particularly advantageous in exhaust-gas catalytic converters for vehicles.

Figure 3 shows scanning-electron microscope images of preferred catalytic converters with dendritic platinum

clusters (Figures 3a, 3b), and with rhodium clusters which are of substantially dendritic form.

Dendritic platinum clusters are preferably deposited on a stainless steel substrate as a result of a direct voltage V_{dc} of 1.4 volts being superimposed with an alternating voltage V_{ac} with $V_{PP}=0.75$ volt (peak-peak voltage swing) and the modulated voltage being applied steel substrate and stainless between a The frequency of the alternating counterelectrode. voltage V_{ac} is 10 Hz. The electrolyte used is platinic acid, in particular hexachloroplatinic acid, with a platinum content of 0.1 g/l. The deposition preferably takes place at room temperature.

15

20

10

The platinum clusters present dendritic growth, and no spherical platinum clusters are observed. The preferred catalytic converter has a high level of activity for hydrogen conversion even in the presence of carbon monoxide, carbon monoxide also being converted with a good yield at the same time.

In the selected system, dendritic platinum clusters are deposited with frequencies of between 5 and 15 Hz and 25 an alternating voltage V_{ac} with a voltage swing V_{PP} of between 0.3-1 volt.

A further preferred catalytic converter is produced by deposition of rhodium on stainless steel, preferably comprising stainless-steel sheet 1.4541 or 1.4571 or 1.4767. It is also possible for mixed catalysts of platinum to be deposited in this way or to deposit catalysts comprising mixtures of precious metals and/or catalytically active materials, such as for example 35 PtRh, PtRu, PdPt.

Deposition takes place from a solution of 0.2 g/l of rhodium in 0.1 M $\rm H_2SO_4$ at room temperature with a direct

10

voltage V_{dc} of 1.4-1.6 volts and a superimposed alternating voltage V_{ac} with $V_{PP}{=}1$ volt (peak-peak amplitude) and a frequency of 10 Hz. The formation of dendritic growth of the clusters can be improved still further by varying the voltage parameters.

A catalytic converter of this type has a good activity for methanol. A catalytic converter of this type is therefore particularly suitable for use in fuel cell vehicles operated with methanol, particularly preferably in catalytic burners.

Figure 4 shows a scanning-electron microscope image of a further preferred catalytic converter with spherical platinum clusters. The deposition takes place using a direct voltage V_{dc} of 1.2-1.4 volts and an alternating voltage V_{ac} with $V_{PP}\!\!=\!\!0.4$ volt and 100 Hz; the deposition bath otherwise corresponds to that used for Figure 3.

- 20 this system, an alternating voltage Vac with frequencies of more than 50 Hz, preferably up 150 Hz, is preferably used for the deposition of spherical platinum clusters. The direct voltage V_{dc} which is applied varies with the substrate pretreatment 25 and, for the deposition of spherical clusters, substantially equal to or tends to be slightly lower that used for than the deposition of dendritic clusters.
- 30 Figure 5 shows a comparison of scanning-electron microscope images of a catalytic converter dendritic platinum clusters before (Figure 5a) and after (Figure 5b) a long-term test, in which the catalytic converter was exposed to an H_2/CO mixture at 35 high temperature for more than 200 h. Although exposed to high temperatures of up to 600°C, the porous or noncohesive platinum layer as catalyst remains stable; the clusters remain fixed in position and do not converge.

The layer which has been deposited in accordance with the invention demonstrates that the clusters in practice do not change before and after long-term use.

5 Figure 6 shows a comparison of rough (Figure 6a) and smooth (Figure 6b) surface profiles of steel substrates which have been used for the deposition of the platinum. The adhesion of the platinum clusters to the roughened substrate is significantly better than the adhesion to the smooth substrate; the layers are wiperesistant, while the layers on an untreated, smooth substrate are not wipe-resistant. The surface roughness is preferably between 0.3 μm and 10 μm, particularly preferably between 0.3 μm and 3 μm.

15

The *catalytic activity and/or selectivity of the catalytic converter differs depending on the particular form of the clusters. A preferred catalytic converter with spherical platinum clusters converts hydrogen in a substantially selective manner. The catalytic converter is poisoned and has a greatly reduced activity in the presence of carbon monoxide. A catalytic converter of this type is preferably used under carbon monoxide-free conditions.

25

30

20

By contrast, a preferred catalytic converter with dendritic platinum clusters firstly has a high tolerance to carbon monoxide during the hydrogen conversion and secondly has a high selectivity and high activity both for the hydrogen conversion and for the carbon monoxide conversion.

Figure 7 shows a measurement curve illustrating the hydrogen conversion achieved by a preferred catalytic converter with spherical platinum clusters. The catalytic converter is exposed to an $\rm H_2/CO$ mixture under standard operating conditions. After even a few

minutes, the hydrogen conversion in the presence of CO falls to low levels.

Figure 8 shows a measurement curve illustrating the hydrogen conversion achieved by a preferred catalytic converter with dendritic platinum clusters. In this case too, the catalytic converter is exposed to an H₂/CO mixture under standard operating conditions. However, t.he measurement curve shows that conversion of hydrogen and for carbon monoxide remains at substantially constant high levels over more than 200 hours. The conversion can in each case be improved further, since the operating conditions have not been optimized.

15

20

25

10

A catalytic converter which has been produced in accordance with the invention is particularly resistant to erosion, and its production can be successfully reproduced. The deposition parameters of the catalytically active material on the substrate easily be optimized for different materials which are deposited by suitably selecting the direct voltage V_{dc} , alternating voltage amplitude V_{PP} and/or frequency. Process control is simple, and the catalytic converter properties can be reproducibly set by simple modifications to the deposition process. The yield of material is good, so that, for example for highly active platinum catalytic converters, relatively small quantities of the precious metal have to be used.

30

35

A preferred use for a catalytic converter produced according to the invention is use in a CO-rich environment, in particular in an exhaust-gas cleaning system in a motor vehicle. A further preferred use of a catalytic converter according to the invention is its use in a fuel cell system.

Patent Claims

- Process for producing a catalytic converter, in 1. which catalytically active material (6, 6.1) is 5 deposited on a substrate (4) as a porous or noncohesive layer, as a result of the substrate (4) immersed in an electrolyte (5) contains the catalytically active material (6) and voltage being applied between the substrate (4) and a counterelectrode (3), characterized in that 10 the catalytically active material (6, deposited on a metallic substrate (4), and in that an electric direct voltage (V_{dc}) , on which an alternating voltage (V_{ac}) is superimposed in such a way that the sign of the sum voltage of direct and 15 alternating voltage (Vac, Vdc) does not change, is applied between substrate (4) and counterelectrode (3).
- 20 2. Process according to Claim 1, characterized in that the direct voltage (V_{dc}) at least corresponds to the deposition potential of the catalytically active material $(6,\ 6.1)$.
- 25 3. Process according to Claim 1, characterized in that the substrate (4) is provided, on its surface (4.1) which is to be coated, with a predetermined surface roughness prior to the deposition.
- 30 4. Process according to Claim 3, characterized in that the surface roughness is in the range from 0.3 μm to 10 μm .

The fifth that was only one of the many of the many of company of the many of

Page 5 15.02.2001

- 5. Process according to Claim 1, characterized in that the catalytically active material deposited as substantially spherical metal clusters (6.1) as a result of the alternating voltage component (V_{ac}) being applied frequency of over 50 Hz.
- 6. Process according to Claim 1, characterized in that the catalytically active material (6) is deposited as substantially dendritic metal clusters (6.1) as a result of the alternating voltage component (V_{ac}) being applied with a frequency of between 5 and 50 Hz.
- 7. Process according to Claim 1, characterized in that the catalytically active material (6) used is a precious metal or a mixture of precious metals and/or catalytically active materials.

Process according to Claim 1, characterized in

- that substantially spherical platinum clusters are deposited on a stainless steel substrate from a solution of a platinum compound in $0.1~M~H_2SO_4$ with a platinum content of approximately 0.1 g/l as a 25 result of a modulated voltage comprising a direct voltage (V_{dc}) approximately of 1.3 superimposed with an alternating voltage (Vac) with a voltage swing (V_{PP}) of 0.3-1 volt and a frequency of 50-100 Hz being applied between stainless steel 30 substrate (4) and counterelectrode (3).
 - 9. Process according to Claim 1, characterized in that substantially dendritic platinum clusters are deposited on a stainless steel substrate from a solution of a platinum compound in 0.1 M H₂SO₄ with

AMENDED SHEET

Official file ref.: PCT/EP00/01914 Internal file ref.: P033547/WO/1 DaimlerChrysler AG

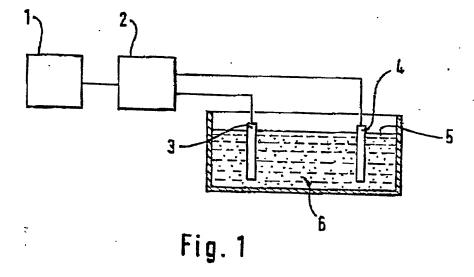

Page 6 15.02.2001

a platinum content of approximately 0.1 g/l as a result of a modulated voltage comprising a direct (V_{dc}) of approximately 1.3 superimposed with an alternating voltage (Vac) with a voltage swing (V_{PP}) of 0.3-1 volt and a frequency of 5-15 Hz being applied between stainless steel substrate (4) and counterelectrode (3).

- 10. Process according to Claim 1, characterized in 10 that substantially dendritic rhodium clusters are deposited on a stainless steel substrate (4) from a solution of a rhodium compound in 0.1 M H2SO4 with a rhodium content of approximately 0.2 g/l as a result of a direct voltage (V_{dc}) of 1.4-1.6 volt 15 being applied between stainless steel substrate and counterelectrode (3) and an alternating voltage (V_{ac}) with a voltage swing (V_{pp}) of 0.3-1.5 volts and frequency of 5-15 а Ηz being superimposed.
 - 11. Process according to Claim 8 or 9, characterized in that the size of the platinum clusters is between 2 nm and 1 µm.
- 25 Process according to Claim 1, characterized in 12. the counterelectrode (3) is formed by platinum-coated titanium.

COMBINED DECLARATION FOR PATENT APPLICATION AND POWER OF ATTORNEY

ATTORNEY'S DOCKET NUMBER

(includes Reference to PCT International Applications)

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

PROCESS FOR PRODUCING A CATALYTIC CONVERTER

the speci	ification of which (check only one item below):
[]	is attached hereto.
[]	was filed as United States application Serial No. on And was amended on (if applicable).
[X]	was filed as PCT international application Number PCT/EP00/01914 on March 4, 2000 and was amended under PCT Article 19 on (if applicable).

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations. §1.56(a).

I hereby claim foreign priority benefits under Title 35, United State Code, §119 of any foreign application(s) for patent or inventor's certificate or of any PCT international application(s) designating at least one country other than the United States of America listed below and have also identified below any foreign application(s) for patent or inventor's certificate or any PCT international application(s) designating at least one country other than the United States of America filed by me on the same subject matter having a filing date before that of the application(s) of which priority is claimed:

PRIOR FOREIGN/PCT APPLICATION(S) AND ANY PRIORITY CLAIMS UNDER 35 U.S.C. 119:
